

Industrial Sliding Gates

GATES

Secure, Reliable Sliding Gate Systems for Industrial & Commercial Sites

Our commercial sliding gates combine durable steel construction, smooth automated operation, and configurable safety systems to keep high-volume sites moving safely. With multiple gate types and custom options, we deliver a solution tailored to your facility's security, traffic flow, and operational needs.

OVERVIEW

Our commercial and industrial sliding gates can be driven safely at higher speeds than a swing gate. Speeds of up to 800mm/second can be achieved safely with speed controllers that allow these automated sliding gates to accelerate and decelerate. If you require gates with higher speeds, you'll need to look for our Bullet Gate™ or Darte Gate™.

Pipe and Mesh

The gates structure comprises sturdy steel pipes for strength, combined with mesh panels that ensure clear visibility. This design not only enhances security by providing a solid barrier but also allows occupants to see through the gate, maintaining a sense of openness while securing the premises.

Vertical Pipe

These gates are engineered to provide maximum security, featuring a design with vertically aligned steel pipes. This configuration creates a formidable barrier that enhances the gates resistance to unauthorised access attempts.

Rodent Resistant / Vertebrate Resistant

Rodent Resistant Gates are specialised barriers designed to prevent pests, such as rodents, from entering a property. Featuring a unique construction that includes materials and design elements specifically chosen to discourage and block rodent entry. These gates drop down onto the tracks once closed to completely seal each side of the gate. These types of gates are essential for maintaining cleanliness and preventing damage caused by unwanted pests.
